SUMMARY

Backend-focused Computer Engineering student (Go, Python, distributed systems) with production experience cutting backend latency 50% at a healthcare startup, open-source microservices contributions, and multiple national hackathon wins.

EDUCATION

Army Institute Of Technology

Bachelor of Engineering, Computer Engineering – GPA: 8.2/10

Pune, Maharashtra

Year of Passing(2027-28)

TECHNICAL SKILLS

Languages: Go, Python, Bash, Java, Javascript, C++ SQL

Backend & Frameworks: FastAPI, Gin, REST APIs, Microservices Architecture

Infrastructure & Tools: Docker, Git, Linux, Claude Code, CI/CD, Bubbletea

Core Concepts: Distributed Systems, Concurrent Programming, Asynchronous I/O, Event-Driven Architecture, Data Pipelines, Test-Driven Development, System Design

EXPERIENCE

Jilo Health

Software Development Engineer

Remote

May 2026 – Jun 2026

- Rewrote insurance reconciliation logic in Go, reducing processing latency by 50%.
- Engineered an AI-powered voice agent for customer care, automating routine support workflows and reducing manual call handling.

OPEN SOURCE CONTRIBUTIONS

Medic Org (cht-core): Refactored cht-conf backend logic toward a microservices architecture, reducing latency by 20%.

LEADERSHIP & ACHIEVEMENTS

Hackathon Winner: 1st place at a national-level hackathon hosted by IIT Patna and Jilo Health (Hackmatrix).

Hackathon Winner: Placed at a national-level hackathon hosted by IISc Bangalore (Rhapsody), competing against 1,500+ participants.

Competitive Programming: Solved 500+ problems across Codeforces, CSES, and LeetCode; rated Pupil on Codeforces.

Coding Cell AIT: Organised a national-level coding competition "Codeft" attracting 300+ participants from 50+ colleges across India.

PROJECTS

Relay – P2P-Based Chat Application | *Go, BitTorrent DHT, TCP, UDP*

[github](#)

- Built a decentralized, peer-to-peer chat application in Go using a BitTorrent-inspired DHT for peer discovery and direct client connections.
- Implemented distributed peer discovery, connection management, and concurrent message routing over TCP and UDP.
- Designed a lightweight custom protocol supporting message serialization, peer identification, and hosted the peer discovery server in my vps.

Normal-Iceee – Healthcare Claims Platform (Group Project) | *Python, FastAPI, React, Supabase*

[link](#)

- Engineered a backend system to process and validate unstructured clinical documents against FHIR compliance standards, reducing manual data entry time by 70%.
- Implemented cryptographically-linked audit trails recording every validation outcome, fallback event, and error for regulatory compliance.
- Designed a custom asynchronous document-splitter pipeline to handle heavy data ingestion without memory bottlenecks, achieving under 30s retrieval time.

Orpheus – AI Linux Package Analyzer | *Go, LLM APIs, Linux*

[github](#)

- Built an AI-powered Linux package analyzer supporting 5 package managers (Pacman, Yay, APT, npm, and pip) through a unified analysis engine.
- Reduced package indexing latency by 60% using concurrent metadata collection with Go goroutines and channels.
- Integrated LLM APIs to generate package explanations, dependency summaries, and safe cleanup recommendations via natural-language queries.
